Chemical Boundary Conditions Most of the relevant hydrodynamic and thermal processes are modeled in CE-QUAL-W2; thus, a time series of concentrations of selected constituents at all inflow boundaries is required for model operation. The horizontal eddy viscosity describes turbulent operation. Boundary data for all tributaries and exchange of momentum, and the horizontal eddy diffusion coefficients included dissolved oxygen, ammonia as nitrogen, nitrite plus nitrate as nitrogen, total phosphorus (table 1). Other parameters such as Chezy resistance, roughness, and a conservative tracer concentrations. Because bottom-water heat exchange, bottom temperature, and of the small amount of available water-quality data, wind-sheltering coefficients were discussed previously annual average concentrations were estimated based on (table 1). In general, reservoir models are relatively similar...
